

#TODO DANAS: * iz nekog razloga run_gammastep.sh ostane upaljen u pozadini stalno? vidi da li treba staviti exit na kraju skriptе, i vidi da li su i sve ostale skripte tako da ostaju u pozadini ukljućene, zašto?, možda i tamo treba staviti taj exit na kraju * tastatura, pogledati kakav je shortcut na windows 10, staviti jedan od tih, ili više * tastatura display na waybar kao na windows 10 * bluelight, toggle (shortcut? ili samo dovoljno da se klikne nešto na tray? možda custom module da napravim ali da izgleda kao da je na tray-u samo da bi mogao da bude clickable??) za bluelight * workspace * Korisne skripte (Misc. Scripts): <https://github.com/swaywm/sway/wiki/Useful-add-ons-for sway>

#TODO backup:

- * ukloniti sve x11/i3 specific stvari iz sway configa. ima vrv mnogo više stvari nego što m
- * dafuq is .config/zsh/.zcompdump?, vrv ne treba da bude u backupu
- * proveriti u virtual machine da li sve radi pre nego što obrisem trenutni arch sistem
- * videti da pre nego što pacman -S sway, prvo skinem mesa drivere ili one druge, treba videti
- * možda staviti da se bluetooth module pali tek kada upalim sway? <https://wiki.archlinux.org>
- * vim :PlugInstall i dalje nije automatski izgleda, ako budeš automatizovao pazi posto se s
- * da pita za username, i onda je full instalacija sa sudo account-a, i da pita za driver ko
- * brave/firefox, njihovi settings i bookmarks potencijalno, ako budem njih dodavao, neka bu
- * awesome font možda može samo da se skine direktno iz repositorija (pacman -S ttf-font-awesome
- * caps lock i escape swap vec u samom tty-u, ne oslanjaj se na sway
- * u install skripti, nemoj koristiti sudo, neko neku promenljivu, tipa \$AUTH, i onda mogu s

#TODO RICE (prio 1): * brave working with video playback * bluetooth * spotify * waybar, * luke smith video za temperature, ima jos nešto, ima video na jutubu za zscroll * workspace-ovi ima na youtube-u i na unixporn ideje, msm da imam jednu dobru u bookmarks * kliktanje na bluetooth module upale bluman * spotify module, sa dugmadima za premotavanje pesme i potencijalno pauziranje * sort celog sway configa?, da bi mogao posle da dodajem nova sranja

rice (prio 2)

- * dodati window border arch linux svetlo plavu opciju, i ostaviti onu fedora opciju
- * all floating shit, dodati i u fedora setup
- * na sway-u mi se cini da resize nije konstantne brzine nego se menja sa velicinom prozora
- * aur
- * dodati padding na alacritty
- * zsh da ne smara na auto-completion-u, videti da neka smaranja ostanu, npr ona sto retko k
- * u konzoli kada uzmem proslu komandu <Escape, k> ne može da se brise na <C-w> vecina koman
- * kul fonts
- * neki key binding-i za transparency, npr da ima jedan key koji smanji transparency trenut
- * staviti da se i compajluje markdown na F6 kao i c++ kod, i da se c++ kod koji se kompajlu
- * dodati da se floating windowi mogu "snap-ovati" kao na windowsu 10, onako u cetvrtine
- * bluelight, i na swaybar da bude gore neka click-able oznaka, možda neki sway shortcut, mo
- * pipes.sh kao wallpaper? (<https://github.com/pipeseroni/pipes.sh>)
- * cbonsai

- * dugme na waybar za sync note-ova na google drive? (ikonica kao strelice koje idu u krug)
- * lock screen na Super+S da sakrije ekran a da idle lock screen ne sakrije, samo blur, ako
- * papirus icons navodno dobar
- * kao jednu cetvrtinu navodno
- * alacritty terminal background color kao kod luke_smith/mental_outlaw
- * OD OVOG TIPKA KRSJA TOGA UZMI: <https://github.com/infernotnt/sway-dotfiles> (evo slike tog t
- * da mi se application launcher upali na svim monitorima i da bude sinhronizovan. ovo je vrv
- * kad stisnem F1 ispise ti sva objasnjenja za shortcuts. nesto potencijalno mozda za linux
- * DOBRA IDEJA: da napravim kao drugi "mod" gde se korsiti scratchpad za: calculator, neki t
- * mozda ove skripte za shutdown kad kliknes na dugme u waybar-u da ne pale "zenity" nego dr
- * numix icon theme?
- * waybar: ona dugmadi za: screen lock, suspend, restart, power off: da se sva stave na jedn
- * waybar: kad kliknes na sat, ili datum ili tako nesto, upali se kalendar
- * navodno (proveri) --no-startup-id, ne radi nista u sway-u, tako da se moze obrisati, ma
- * dircolors
- * base16 themes? (tip koji je spomenuo je hard hard core ricer, mozda je previse ovo)
- * quote za rice na dnu fajla
- * dmenu, rofi, wofi
- * fade (kao compton)
- * waybar: separator na right modules izmedju tray-a (ili kako god se zove, ono za recimo d

#guide ##waybar: * klikanje na program u taskbaru: levi klik - focus; middle click - iskljuci * kad naciljas na procesor module pise koliko koji core trosi * klikanje na cpu/memory module pali htop * audio module: * klikanje na audio module pali pavucontrol * mouse scroll na pulseaudio module utisava/pojacava * desni klik - mute mikrofoni * TODO: srednji klik - mute zvuk

#TODO laptop: wifi, baterija, brightness?

#waybar random ideje: * termometar za temperaturu da bude napunjen do kraja ili skoro prazan

#TODO USER - PRE-INSTALL * pre svega, mozda namestiti pacman config da bude lep dok se sve skida, ako moze bez sed, bilo bi super * username? depends on the installer i guess, maby just make it so the user has to run with an already made non root account (but still in sudoers file)? * set your graphics card drivers

#TODO USER - POST-INSTALL: * change ~/.config/git/config * visudo, add yourself to wheel and make it so password isn't required (TODO: this is perhaps possible to automate) * your location for gammastep (.config/gammastep) * keyboard layout (english and serbian by default)

#=====

Downloaded compressed packages are still kept on the system at /var/cache/pacman/pkg/

Arch komande se obicno sastoje od prvo jednog velikog slova(e.g., S, R, Q) i mnogo malih slova.

pacman -S, sync(install/update) package

pacman -Syu, synhonorize package database and upgrade whole system(recommended) pacman -Sy, synchronize package database(not recommended) pacman -Su, upgrade whole system(not recommended)

pacman -Syyu, kad ima 2 y, tera ga da update-uje database iako je keshiran update od malo pre pacman -Sw, skine, ali i ne instalira nego ostavi download file, pa ti sam moras posle instalirati

pacman -Ss, search all packages in title and description

pacman -R, remove package pacman -Rs, remove package and its unused dependencies pacman -Rn, remove package and its system config files

pacman -Rsn, best for removing a package

pacman -Q, prints all installed packages pacman -Qe, prints all explicitly installed packages pacman -Qq, does not print out the version, only the program name (q radi skoro svuda)

pacman -Qdt, list of orphans

pacman -Qs, search for locally installed packages

pacman -Si, information for a package

pacman -Qi, information for a locally installed package U file-u /etc/pacman.conf:

#Quote za rice: In my opinion, what matter the most to make your desktop experience look elegant is to make colors consistent across apps.

Start at base16, it is a way to standardize coloring across apps. Choose a color scheme (you can create your own but I would start by one of the defaults). This can be some gruesome work, as some apps are not so friendly to customization.

As other users said Waybar is important. Choose what information you need to be displayed and try to apply the color you choose. You can see some reference for Waybar on github or on r/unixporn.

For Sway itself, the only coloring is in the title bar and window border. Look for “client.” on Sway man page for how to change the coloring of that.

Then there is the Browser and the Terminal which are generally the most important apps. I guess it is safe to say that most of us try to use a browser with no UI. Qutebrowser is popular, I use Firefox+Trydactyl. Again try applying the colors of your color scheme using base16.

For terminal there are plenty of options but I usually go for either Alacritty or Kitty. Applying the colors is fairly easy, use can again use base16 or copy one of

the many dotfiles you will find online.
